

Assignment 12: Random Markov Text

cs230
Spring 2002

Allen B. Downey
Computer Science Department

Due: Wednesday 8 May

Read the handout from *The Practice of Programming* and write a program that reads a text file and then generates 1000 random words using the Markov algorithm.

For this assignment, it is up to you to design the program pretty much from scratch.

- Choose data structures.
- Organize the program into classes.
- Design interfaces between the classes.
- Make a program development plan that will allow you to write and test small pieces of code at a time.

I have one hint and one warning: the hint is that I think the data structure Kernighan and Pike use is not the best choice. The warning is that there is a Java version of this program in the book I took the handout from, but you should avoid looking at it, because it will probably be more confusing than helpful, not to mention posing a moral hazard.

If you are careful in your design I think you can create an implementation of this algorithm that is much nicer than theirs.
